

What has been working?

The Tkinter is working and it create a simple GUI. We have a general idea and ability to create the GUI, and we will make it better in the future.

What has not been working?

Our origin goal of the project is making an app based on a real bank transaction history, so we can web scraping data from the bank webpage. However, we are not allowed to do that, and we cannot find a mimic transaction history page for our project.

What can you do differently to address what hasn't been working?

We will create a csv file and load all the data into our program. Then, we can do the analysis.
